

没有Wget的日子是非常难过的，强大的Mac OS 下安装Wget非常简单  
下载一个Wget的源码包，<http://www.gnu.org/software/wget/>

A screenshot of a macOS terminal window. The title bar shows three colored window control buttons (red, yellow, green) on the left. The terminal text shows the command 'tar zxvf wget-1.9.1.tar.gz' being executed in a directory 'lihaomatoMacBook-Pro:Desktop debuglee\$'. The output shows the extraction of 'wget-1.9.1/', 'wget-1.9.1/doc/', and 'wget-1.9.1/doc/ChangeLog-branches/'. In the background, a file explorer window is partially visible, showing 'Macintosh HD', 'iDisk', and 'BOOTCAMP'.

打开终端解压，

1 输入：tar zxvf wget-1.9.1.tar.gz

2 cd 进入到解压的目录

3 输入：./configure

4 输入：make

5 输入：sudo make install

输入秘密 OK 安装完成！

一般会报这个错：

configure: error: --with-ssl was given, but GNUTLS is not available.

```
1. ./configure --with-ssl=openssl
```
